Scope of this session

- Ant: A brief overview
- How Eclipse uses Ant
- Customization through Ant
- The inevitable need for extension
- Extension through PDE

Scope of this talk

Ant: Overview

- Ant is a cross-platform build tool that was created as a replacement to the `make` application
- It accepts input from a file written using XML tags and utilizing the following hierarchical structures
 - `project` - top level of an ant build file
 - `target` - functional work units of an ant file
 - `tasks` - atomic operation
- Usage of Ant usage has extended beyond its original use as a build system
- Ant allows the creation of custom tasks

Do I need Eclipse?

- If you're adventurous, all you need for writing most Java/JEE applications, are:
 - A text editor (vi, emacs, Textpad or Notepad)
 - A Java Development Kit
 - Appropriate runtime libraries
 - **And absolutely no deadline**
- For the rest of us, we need tools:
 - Eclipse provides them
 - Each Eclipse sub project provides a set of tools

Extending Eclipse

- What?
 - Expansion of the platform to provide functionality suiting a specific need.
- Why?
 - Integrating tools within the IDE simplifies the development process and promotes uniformity of access.
- How?
 - Using Ant - Eclipse uses Ant, the equally popular (and capable) build tool for a litany of internal operations. It provides support for customisation of a project's build script.
 - Using PDE - The Plug-In Development Environment provides a powerful tool that can be used in the creation/customization of plug-ins for Eclipse.

Extension using Ant

- Eclipse uses Ant internally for its build operations and provides facility for extension.
- It is the easiest form of extension with the least learning curve.
- Ability to reuse existing build files created for other IDEs that support Ant integration.

How?

© 2006 by WTP PMC; made available under the EPL v1.0 | Cambridge | September 6, 2006

Steps for Ant Extension

1. Export build file from project
2. Create your buildfiles(s) in the same directory
3. Add the `<?eclipse.ant.import?>` processing instruction
4. Re-export the build file from the project

The pre-Eclipse 3.2 way:

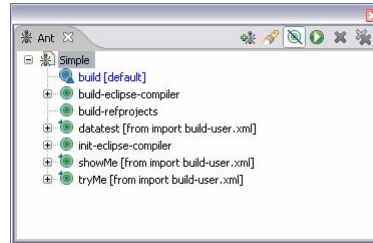

- Export build file from project
- Add targets to build-user.xml

Ant View [Method 1]

Window ▶ Ant
Window ▶ Show View ▶ Other ▶ Ant ▶ Ant

- Shows all your targets
[Tip: Hide internal targets to reduce clutter]

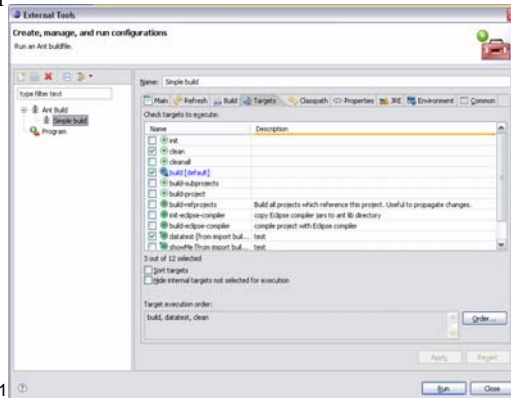

© 2006 by WTP PMC; made available under the EPL v1.0 | Cambridge | September 6, 2006

Create Configuration [Method 2]

Run ▶ External Tools ▶ External Tools ▶ Ant Build

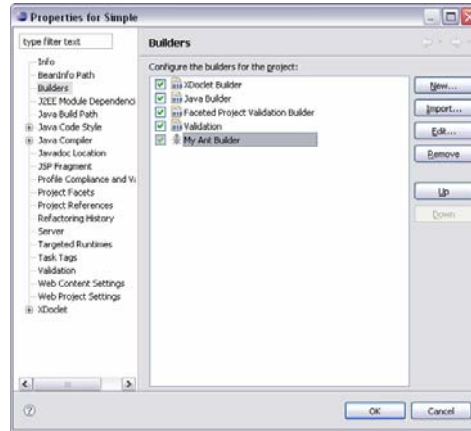

- Supports the invocation of a composition of targets
- Could be replicated with a target that uses `<ant:call>` tasks
- Allows sharing configuration

Ant Builder [Method 3]

Project Properties ► Builders

- Automates your build process using your defined targets

Limitations of Ant Integration

- Suited for transient operations
 - Context based support is not available and the usage of command-line arguments to simulate this is arguably cumbersome.
- Cannot support functionality that requires integration with Eclipse. E.g.
 - Supporting a new server runtime definition
 - Integration with actions/views

Extension using PDE

- Two mechanisms exist for PDE extension:
 - Fragments
 - Plug-ins
- Fragments extend the behaviour of a host plug-in to provide additional functionality without the need of a full release. E.g.
 - Providing support for additional server runtimes
 - Plug-in internationalisation
- Plug-ins are pluggable modules that can be used to extend the functionality of the Eclipse platform. A plug-in can extend other plug-ins and provide extension points so that it can itself be extended.

Steps for PDE Extension

1. Create Plug-In or Fragment
 - a. Create PDE Project
 - b. Create class(es)
 - c. Add libraries (as needed)
 - d. Add Extension to reference class(es)
2. Package for deployment by:
 - Packaging as a plug-in jar
 - Creating a Feature
 - Packaging as a feature jar
 - Creating an Update Site
3. Deploy

Challenges of using PDE

- An associated learning curve.
- Finding the appropriate extension point for plug-ins.
- Version dependency.
